

Lin Wang 王林

Postdoctoral Researcher - AI for Molecular Discovery

Suzhou, China - Wanglin1102@outlook.com - Website - GitHub - Google Scholar - ORCID

Lin Wang develops AI methods for molecular representation, protein modeling, and drug discovery. Current research focuses on molecular foundation models, conformational-space and pharmacophore-aware representation learning, phenotype-based screening, and structure generation. Recent work includes Ouroboros, a property-guided molecular generation framework published in *Advanced Science*, and earlier systems for protein interaction mining, synthetic accessibility prediction, and virtual screening.

Research Focus

- Molecular representation and generation foundation models for medical chemistry
- Conformational-space and pharmacophore-aware molecular representations
- Protein-ligand and protein-protein interaction modeling
- Phenotype-based and poly-pharmacology drug design

Education and Experience

Current	Postdoctoral Researcher Institute of Systems Medicine, Chinese Academy of Medical Sciences, Suzhou, China. Molecular and protein foundation models, phenotype-based learning, and translational drug discovery.
2020-2024	Ph.D., ShanghaiTech University Structural biology, molecular dynamics, protein interactions, and physically informed molecular representation.
2019	B.S. in Life Science, Northeast Agricultural University Biological foundations and early computational drug-discovery workflows.

Selected Research Projects

2026	Ouroboros Property-guided molecular generation in a learned encoding space. A shared representation supports molecular graphs, property prediction, and SMILES generation. Advanced Science paper - GitHub repository
2024	GeminiMol Conformational-space profiling for general molecular representation. Hybrid contrastive learning integrates conformational and pharmacophore similarity. Using GeminiMol, we identified an inhibitor of GluN1/GluN3A ($IC_{50} = 0.98 \mu M$); the work received first prize in the 2023 Shanghai International Computational Biology Innovation Competition. Advanced Science paper - GitHub repository - Application: Discovery of novel GluN1/GluN3A NMDA receptor inhibitors using a deep learning-based method
2022	PPI-Miner Structure and sequence motif co-driven method for protein-protein interaction mining and modeling. Applied to molecular glue substrate discovery, leading to a curated library of potential CRBN protein substrates. J. Chem. Inf. Model. paper - GitHub repository - CRBN substrate library
